# The Human Genome Sequence

Science Feb 16 2001 & Nature, Feb 15, 2001

**The human genome has ~ 3 billion nucleotides (letters)**

Microarray

**DNA sequencers can read genomes in 24 hrs**

# Targets for Sequencing

## Genome

There are ~20,000 genes in our genome. The coding portion of genes is called the "exome"

## Exome

Of the ~20,000 genes, ~4700 are associated with a Mendelian Disorder ("Mendeliome")

## Mendeliome

Of the ~4700 Mendeliome genes, ~600-700 are associated with a Monogenic nephropathy ("Nephrome")

# Utility of Whole Exome Sequencing in Adults with CKD

**Table 1. Clinical Characteristics of the Patients.\***

| Characteristic                      | AURORA Cohort<br>(N=1128) | CUMC Cohort<br>(N=2187) | Overall Study<br>Population<br>(N=3315) |
|-------------------------------------|---------------------------|-------------------------|-----------------------------------------|

# ES Provides a Diagnostic Yield of 9.3% in patients with CKD, N = 3,315

# Clinical Predictors of Diagnostic Yield

# Case Studies

## Case

- 46 yo woman with newly diagnosed kidney disease with blood & protein in urine
- Family hx of kidney disease in 2 uncles
- Kidney biopsy: focal segmental glomerulosclerosis (FSGS)
- Exome Sequencing reveals diagnosis of X-linked Alport Syndrome
- Treatment: avoid steroids, refer for new clinical trial
- Screen family members at risk

## Clinical presentation of Classic Alport syndrome

- Hematuria
- Sensorineural hearing loss
- Pathognomonic findings on kidney biopsy
- Anterior lenticonus

Alport Foundation

## Genes:

- *Chr. 2 COL4A3* – Dom & Rec
- *Chr. 2 COL4A4* – Dom & Rec
- *Chr. X COL4A5* – X-Linked

# Case Studies

## Case

- 46 yo with newly diagnosed kidney disease with blood & protein in urine
- Family hx of kidney disease in 2 uncles
- Kidney biopsy: focal segmental glomerulosclerosis (FSGS)
- Exome Sequencing reveals diagnosis of X-linked Alport Syndrome
- Treatment: avoid steroids, refer for new clinical trial
- Screen family members at risk

Phenotypes Associated with *COL4A3*, *COL4A4*, or *COL4A5* pathogenic variants

# CKD of Unknown Cause

## Review of 6 exome sequencing studies of CKD:

- 443 patients
- 22% diagnostic rate
- 47 genetic diagnoses made, of which 29 (62%) represented singleton diagnoses unique to one patient
- *COL4A3-5* mutations accounted for one-third of cases

# Diagnostic Performance of Exome vs. Panel Sequencing

# What To Do With a Negative Genetic Test?

---

- **Consider blind spots in sequencing assay**
  - Genes or exons not captured /covered
  - Classes of mutations not readily surveyed by NGS: CNVs, indels, mosaicism, retrotransposition, VNTR
  - Non-coding variants
- **Consider periodic reanalysis of data**
- **Consider alternative inheritance models: e.g. polygenic**
- **Non genetic causes**

# Systematic Reanalysis Increases Diagnostic Yields

# Genetics in chronic kidney disease: conclusions from a Kidney Disease: Improving Global Outcomes (KDIGO) Controversies Conference

OPEN

KDIGO Conference Participants<sup>1</sup>

**Figure 4 | Actionable genes in kidney diseases.** Actionability refers to the potential for genetic test results to lead to specific clinical actions for prevention or treatment of a condition, supported by recommendations based on evidence. ADPKD, autosomal dominant polycystic kidney disease; aHUS, atypical hemolytic uremic syndrome; RAAS, renin–angiotensin–aldosterone system; SRNS, steroid-resistant nephrotic syndrome.

## SYMPTOMATIC ADULT and PEDIATRIC PATIENTS

### General recommendation for genetic testing

Genetic testing is indicated in all kidney-related abnormalities where genetic etiology is considered after appropriate clinical evaluation.

#### Specific recommendations for genetic testing

- Family History (see<sup>1</sup>)
- Multi-organ syndrome of unknown etiology
- Atypical clinical disease, to guide therapeutics, or is requested by the individual (reasons may include prognostication, family planning, etc.)
- Kidney biopsy findings suggestive of a genetic cause (e.g.):
  - Chronic TIN<sup>4</sup> with crystals<sup>5</sup>
  - FSGS without obvious secondary causes
  - Features suggestive of collagen IV nephropathy
  - TMA or idiopathic MPGN
  - Lipidoses
- CKD/ESKD of unknown etiology after a comprehensive clinical evaluation if **ANY** of the following criteria are met:
  - Age < 50 years
  - Patient's blood relative is considering kidney donation
  - Diagnosis may aid in management of extra-renal manifestations
- Evaluation of patients with atypical cystic kidney or liver disease and no family history
- Testing will end a diagnostic odyssey
- Test is for kidney donor evaluation

Is the patient suspected to have the same disease as an affected relative in whom the precise pathogenic variant is known?<sup>1</sup>

Yes

Test for specific variant, if test available

No/Unknown

Large multi-disease kidney panel<sup>1</sup>

Negative, but strong suspicion of genetic etiology remains

Whole exome sequencing or whole genome sequencing<sup>2\*</sup>

If no deletions or microduplications detected:

CAKUT<sup>2\*</sup> diagnosis

Chromosomal microarray

## AT-RISK ADULT and PEDIATRIC INDIVIDUALS

Prior to testing at-risk individuals, it is preferred to establish genetic diagnosis in the affected relative.

# Patient Questions

---

- What is this disease?
- Why do I have this disease?
- What will happen to me?
- What are the treatment options?
  
- “Doctor, should we perform genome sequencing to answer some of these questions?”

# Genome or Exome Sequencing of 5,727 Patients with CKD

CureGN: N= 1913

Columbia-GN, N=1098

Columbia-CKD, N= 2716

## Diagnostic Yield

Monogenic Nephropathies  
N= 371 (6.5%)

High-risk *APOL1* Genotypes  
N= 318 (5.5%)

## Kidney Failure

HR = 1.72  
(1.38 – 2.14)

HR = 1.67  
(1.42 – 1.96)

## eGFR Decline

3.31  
mL/min/year  
faster decline

2.50  
mL/min/year  
faster decline

## Lack of Complete Remission

OR = 5.25  
(2.56 – 10.77)

OR = 1.36  
(0.79 – 2.31)

# Monogenic Disorder have a Faster Progression to ESKD (5734 adults and children with kidney disease)

# Patients with Genetic Diseases May Have Reduced Mortality after Kidney Failure

**Figure 2.** Unadjusted Kaplan Meier curves for patient survival after starting kidney replacement therapy – (A) dialysis, (B) kidney transplant.

# The Clinical Utility of Genetic Testing in the Diagnosis and Management of Adults with Chronic Kidney Disease

## METHODS

RenaCARE (NCT05846113)

N=1623

### Clinical Utility

- Treatment Plan
- Family Planning
- Genetic Counseling
- At-risk Family Members

### Diagnostic Utility

- Confirm (34.0%)
- Diagnose (30.8%)
- Diagnose, partial (15.7%)
- Reclassify (2.4%)
- At risk (17.2%)

## RESULTS

**Diagnostic yield = 20.8%**

(Range: 8.6% – 49.6% across disease categories)

**Management Impacts reported for 90.7% of Patients with Positive Genetic Findings**

**New\* or reclassified diagnosis established in 48.8% of Positive cases**  
(New: diagnose + diagnose, partial)

**CONCLUSION:** Genetic testing with a CKD-focused 385-gene panel substantially refined clinical diagnoses and had widespread implications for clinical management.

**Figure 2: Frequency of causal clinically relevant adverse drug reactions in patients with an actionable test result**  
Error bars represent 95% CIs for event rates. p values for intergroup differences were based on the mixed-effects models used in the primary analysis. An actionable test result was defined as a drug-gene interaction for which the Dutch Pharmacogenetics Working Group guidelines recommended a change to standard-of-care drug treatment.

# Population Pharmacokinetic Model for Tacrolimus Dosing

A prospective controlled, randomized clinical trial of kidney transplant recipients developed personalized tacrolimus dosing using model-based Bayesian Prediction.

**kidney**  
INTERNATIONAL

## Methods and cohort

**Clinical trial:** Two-arm, Randomized, Open-label, single-center  
Designed as a superiority study (30%)

## Findings

### Primary endpoint:

Proportion of patients within therapeutic target in the first steady-state (30% margin):

### Secondary endpoints (90 days of follow-up):

Patients achieved faster tacrolimus therapeutic target concentration (6-10 ng/mL)  
*5 days (PPK) vs 10 days (Control)  $P < 0.05$*

Patients showed less intra-patient variability  
*24.7 (PPK) vs 35.8 (Control)  $P < 0.05$*

Patients had a lower number of dose modifications  
*1 (PPK) vs 2.6 (Control)  $P < 0.05$*

There was a lower percentage of patients with overexposure or infraexposure to tacrolimus  
*26% (PPK) vs 55% (Control)  $P < 0.05$*

No statistically significant differences were observed in clinical outcomes

Lloberas et al, 2023

**CONCLUSION:** PPK-based tacrolimus dosage offers significant superiority for starting tacrolimus prescription over the classical labelling-based dosage according to the body weight, which may optimize Tac-based therapy since the first days after transplantation.

## Current Paradigm

## Future Paradigm

# Summary

---

- Monogenic kidney diseases may be present in ~10% of CKD patients
- The prevalence of genetic disease varies by age, family history and clinical diagnosis, and referral population studied
- The detection of genetic disease has many implications for disease management, including therapy
- Other useful information in genetic testing include risk alleles, carrier screening and pharmacogenetics
- Predictive testing for kidney disorders will require better curation of variant databases and may need to be restricted to selected, well studied genes
